

Global Xpress coverage

Each Inmarsat satellite carries 89 Ka-band beams and operates in geosynchronous orbit with flexible global coverage. Beam and satellite switching are automatic and seamless. Global Xpress is the first service to offer global mobile broadband coverage, delivering unparalleled speeds and bandwidth to customers in remote locations around the world. It is faster and less expensive than current Ku-band market offerings, delivered to smaller terminals and is the first offered on a seamless, global, end-to-end basis, with high quality of service.

Users of existing Inmarsat global services will be able to take advantage of unique hybrid packages that use both Inmarsat's L-band and Global Xpress networks. Offering unprecedented scalability, these will also ensure increased resilience and reliability in remote and harsh environments.
